Unintentional Drug Poisoning in Sonoma County: A Focus on Prescription Opioids

2014 Summary Impacts on the Sonoma County Health System:
Annual Unintentional Drug Poisonings

Treat and release emergency department (ED) visits for which unintentional (UI) drug poisoning was the principal cause of admission among Sonoma County residents. Of UI drug poisonings, 20% (n=88) were for opiates; of these, 72% were for pharmaceutical opioids, and 28% for heroin.

Hospitalizations for which UI drug poisoning was the principal cause of admission among Sonoma County residents. Of UI drug poisonings, 30% (n=57) were for opiates; of these, 93% were for pharmaceutical opioids.

Deaths (annual average) from UI drug poisoning. (*2013-15 annual average).

Sonoma County Residents

- The Sonoma County rate of non-fatal, treat and release, ED visits for UI drug poisoning due to opiates increased 73% from 2009-11 to 2012-14 (10.0 vs. 17.3 per 100,000 population, respectively) (Figure 1). This was a significant increase (p-value <0.05) over the time period.

- The age-adjusted rate of non-fatal, treat and release ED visits for UI drug poisoning due to opiates in Sonoma County was significantly higher (p-value <0.05) than California in 2012-14 (15.8 vs. 9.8 per 100,000 population, respectively, data not shown).

- The Sonoma County rate of non-fatal hospitalization for UI drug poisoning due to opiates was 12.9 per 100,000 population in 2012-14. This rate did not change significantly from 2009-11 to 2012-14 (Figure 2).

- The rate of non-fatal hospitalization for UI drug poisoning due to opiates in Sonoma County was significantly higher (p-value <0.05) than California in 2012-14 (age-adjusted, 10.7 vs. 7.3 per 100,000 population, respectively; data not shown).

2014 Findings—Sonoma County residents with an opioid prescription

<table>
<thead>
<tr>
<th><strong># of unique patients with an opioid rx</strong></th>
<th><strong>126,000 people</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Age</td>
<td>Median age: 53 years. People over 65 year of age (41%) were more likely to have an opioid prescription.</td>
</tr>
<tr>
<td>Gender</td>
<td>58% of patients were female.</td>
</tr>
<tr>
<td>Patients and opioid rx</td>
<td>53% of patients with an opioid prescription only had one opioid prescription; 25% had four or more opioid prescriptions.</td>
</tr>
<tr>
<td>Patients and prescribers</td>
<td>71% of patients received their prescription from only one prescriber; 5% of patients had opioid prescriptions from four or more prescribers.</td>
</tr>
<tr>
<td>Doctor shopper</td>
<td>524 (or 0.4%) of all patients were identified as doctor shoppers.**</td>
</tr>
</tbody>
</table>

Note: These data include Sonoma County residents who had an opioid prescription filled in the United States in 2014, regardless of where it was prescribed or filled. “Rx” = prescription.  
**Doctor shoppers were defined as patients who obtained opioid prescriptions from 4 or more prescribers and 4 or more pharmacies in 2014.

Figure 3. Percentage of dispensed opioid prescriptions to Sonoma County residents, by type of opioid, CURES 2014 (N=459,000 opioid prescriptions)

- Hydrocodone: 56.8%
- Oxycodone: 18.3%
- Morphine: 6.5%
- Codeine: 4.5%
- Methadone: 3.8%
- Tramadol: 3.5%
- Other*: 6.7%

*includes buprenorphine, hydromorphone, fentanyl, oxymorphone, and other drug classes.

BACKGROUND—THE NATION AND CALIFORNIA

Prescription drug abuse is at epidemic levels according to the Centers for Disease Control and Prevention. In 2013, there were 43,983 drug overdose deaths in the United States, making drug overdose the number one cause of injury-related death in the United States [1]. In 2013, 58% (22,767 deaths) of drug overdose deaths were related to pharmaceuticals; 71% (16,235 deaths) of these involved opioid analgesics and 31% involved benzodiazepines (some deaths included more than one drug type) [2]. The rate for drug poisoning deaths involving opioid analgesics nearly quadrupled from 1.4 to 5.1 per 100,000 from 1999 to 2013, whereas the drug poisoning death rate doubled during this time period (6.1 to 13.8 per 100,000) [1].

In California, deaths involving opioid prescription medications have increased 17% since 2006. In 2012, there were more than 1,800 deaths from all types of opioids, of which 72% involved prescription opioids [3].
